

AI-ML VIRTUAL INTERNSHIP INTERNSHIP REPORT

AICTE – EduSkills Virtual Internship Program

Internship Domain: Google AI-ML

Submitted By:

Rohit Maurya

B.Tech (Artificial Intelligence (AI) and Data Science)

IILM University, Greater Noida

Internship Duration

January 2026 – March 2026

10-Week Virtual Internship Program

CERTIFICATE

Official Internship Certificate — AI-ML Virtual Internship

DECLARATION

I hereby declare that the internship report entitled “**AI-ML Virtual Internship**” is prepared by me as part of my academic internship work for the **AICTE–EduSkills Virtual Internship Program**.

The report presents the learning, technical concepts, activities, and outcomes associated with the **10-week AI-ML Virtual Internship** conducted during **January 2026 to March 2026**. The internship was undertaken in the **Google AI-ML** domain through the EduSkills Virtual Internship Program.

I further declare that the information presented in this report has been prepared based on the internship materials, learning activities, and supporting documents available to me. Wherever supporting evidence or screenshots are required, they will be included from the original internship records.

I understand that any false or misleading information presented in this report may affect its academic validity.

Name: Rohit Maurya

Programme: B.Tech (Artificial Intelligence (AI) and Data Science)

Institute: IILM University, Greater Noida

Date: 19-08-2026

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **IILM University, Greater Noida**, for providing me with the opportunity to undertake this internship as part of my B.Tech (Artificial Intelligence (AI) and Data Science) academic journey.

I am thankful to **EduSkills** and the **AICTE–EduSkills Virtual Internship Program** for providing the opportunity to participate in the **10-week AI-ML Virtual Internship** in the **Google AI-ML** domain. The internship provided structured learning and practical exposure to important areas of artificial intelligence and machine learning.

I am grateful for the learning opportunities provided throughout the internship, particularly in areas such as **neural networks with TensorFlow, object detection, product image search, and image classification**. The week-wise structure helped in developing a systematic understanding of these concepts.

I would also like to express my appreciation to the faculty members and mentors who supported and guided me throughout my academic and internship journey. Their guidance and encouragement helped me approach the technical topics with greater interest and discipline.

Finally, I would like to thank everyone who contributed directly or indirectly to the successful completion of this internship and preparation of this report.

Rohit Maurya

B.Tech (Artificial Intelligence (AI) and Data Science)

IILM University, Greater Noida

INTRODUCTION

1.1 Introduction to Artificial Intelligence and Machine Learning

Artificial Intelligence (AI) is an important area of computer science that focuses on developing systems capable of performing tasks that normally require intelligent human behaviour. Machine Learning (ML) is a major area within AI in which computational models learn patterns from data and use those patterns to perform specific tasks.

AI and ML have applications in areas such as image recognition, classification, object detection, search systems, and mobile applications. These technologies have also contributed to the development of modern computer vision systems.

1.2 Role of Computer Vision in AI-ML

Computer vision is an area of artificial intelligence concerned with enabling computer systems to process and understand visual information such as images and camera feeds. Important computer-vision tasks include **image classification** and **object detection**.

Image classification determines the category of an image, whereas object detection identifies objects within an image. These concepts form important parts of the technical curriculum covered during the internship.

1.3 Introduction to the Internship

The **AICTE–EduSkills Virtual Internship Program** provided a structured **10-week AI-ML learning program** in the **Google AI-ML** domain. According to the official offer letter, the internship was scheduled from **January 2026 to March 2026** and included structured learning, weekly assessments, project documentation or assignments where required, and final assessment requirements.

The internship curriculum covered **neural networks with TensorFlow, object detection, custom object detection, product image search, and image classification**. These topics provided exposure to different areas of AI and computer vision through a week-wise learning structure.

INTERNSHIP OVERVIEW

2.1 About the Internship

The **AICTE–EduSkills Virtual Internship Program** is a structured internship program designed to provide students with industry-relevant learning and practical exposure in a specific subject area. According to the official internship offer letter, the program was conducted as a **10-week virtual internship** in the **Google AI-ML** domain.

The internship duration was specified as **January 2026 to March 2026**. The program followed a week-wise learning structure through which different concepts and applications related to artificial intelligence, machine learning, and computer vision were covered.

2.2 Internship Structure

The internship was organized into weekly modules. The documented curriculum began with **neural networks using TensorFlow**, followed by **object detection**, **custom object detection**, **product image search**, and **image classification**. The final weeks were dedicated to assessment and final credential validation.

The internship also included **weekly assessments**, while certain modules required **project documentation and assignments**. The final grade was based on overall performance, including the required assessments, project submissions, and final test.

2.3 Internship Details

Particular	Details
Program	AICTE–EduSkills Virtual Internship Program
Internship Domain	Google AI-ML
Internship Type	Virtual
Duration	10 Weeks

Particular	Details
Period	January 2026 – March 2026
Institute	IILM University, Greater Noida
Branch	B.Tech (Artificial Intelligence (AI) and Data Science)
Student	Rohit Maurya

The student and internship details above are stated in the official offer letter.

2.4 Major Areas Covered

The major documented areas of the internship were:

- Neural Networks with TensorFlow
- Object Detection
- Custom Object Detection
- Product Image Search
- Image Classification
- Assessment and Credential Validation

OBJECTIVES OF THE INTERNSHIP

3.1 Introduction

The objective of the AI-ML Virtual Internship was to provide structured learning and practical exposure in the subject area of **Artificial Intelligence and Machine Learning**. The official internship document states that the program was designed to develop industry-relevant skills and strengthen students' confidence in the subject area.

Based on the documented internship curriculum, the major objectives were:

3.2 Learning Objectives

1. To understand machine learning fundamentals

To develop an understanding of fundamental machine learning concepts and their application in AI-based systems.

2. To learn neural networks using TensorFlow

To understand neural networks and use TensorFlow for learning and developing neural-network-based solutions. The first week specifically focused on neural networks with TensorFlow.

3. To understand computer vision concepts

To gain knowledge of computer-vision tasks involving images and visual information, particularly image recognition, object detection, and image classification.

4. To understand object detection

To learn the fundamentals of object detection and understand the use of pretrained object detectors.

5. To learn custom object detection

To understand how custom object-detection models can be trained using **TensorFlow Lite** and the **TensorFlow Lite Model Maker library**.

6. To understand product image search

To learn how object detection can be used for product image search and how visual search functionality can be developed for mobile applications.

7. To understand image classification

To learn about custom image-classification models and the process of improving image-classification capabilities.

8. To gain structured practical exposure

To follow a week-wise learning structure involving assessments and, where required, project documentation and assignments.

9. To evaluate learning through assessments

To complete the assessment requirements of the internship, including the final assessment and credential validation.

TECHNOLOGIES AND TOOLS

The AI-ML Virtual Internship covered several technologies and technical areas related to artificial intelligence, machine learning, and computer vision. The following technologies and concepts are identified in the official week-wise internship structure.

4.1 Major Technologies and Concepts

Technology / Concept	Description	Internship Relevance
TensorFlow	A framework used for developing machine-learning and neural-network solutions.	Week 1 focused on programming neural networks with TensorFlow.
Neural Networks	Computational models used for learning patterns from data.	Covered during the first week of the internship.
Convolutional Neural Networks (CNNs)	Neural-network architectures used for image-related tasks.	Included in the image recognition and classification learning pathway.
TensorFlow Lite	A technology used for deploying machine-learning models in lightweight environments.	Used in the custom object-detection module.
TensorFlow Lite Model Maker	A library used for creating custom machine-learning models.	Used for custom object-detection model training.
Object Detection	A computer-vision task used to identify objects in visual data.	Covered during Weeks 2 and 3.

Technology / Concept	Description	Internship Relevance
Product Image Search	A visual-search approach involving product images and object detection.	Covered during Weeks 4–6.
Image Classification	A computer-vision task that assigns images to categories.	Covered during Weeks 7–8.
Android / Mobile Integration	Integration of visual AI capabilities into mobile applications.	Mentioned in the object-detection and product-image-search modules.

The technologies and topics above are based on the documented weekly curriculum in the offer letter.

4.2 Relationship Between the Technologies

The internship curriculum progresses from fundamental AI/ML concepts toward computer-vision applications:

Neural Networks & TensorFlow

↓

Object Detection

↓

Custom Object Detection with TensorFlow Lite

↓

Product Image Search

↓

Image Classification

This progression follows the sequence of modules documented in the internship structure.

WEEK-WISE INTERNSHIP ACTIVITIES

5.1 WEEK 1 — PROGRAM NEURAL NETWORKS WITH TENSORFLOW

The first week of the internship focused on **programming neural networks with TensorFlow**. The module introduced the fundamentals of machine learning and neural networks and provided an understanding of how these concepts can be applied to computer-vision problems.

The learning pathway covered the fundamentals required to understand machine learning and introduced **convolutional neural networks (CNNs)** for advanced image recognition and classification.

Key Topics Covered

- Fundamentals of machine learning
- Neural networks
- TensorFlow
- Convolutional Neural Networks (CNNs)
- Image recognition
- Image classification

The first week's module established the basic foundation for the computer-vision topics covered in the following weeks.

5.2 WEEK 2 — GET STARTED WITH OBJECT DETECTION

The second week focused on the **fundamentals of object detection**. Object detection is an important computer-vision task concerned with identifying objects within visual data.

The documented module introduced the basics of object detection and the integration of a **pretrained object detector into a mobile application**.

Key Topics Covered

- Fundamentals of object detection
- Pretrained object detectors
- Object detection in visual data
- Mobile application integration

Learning Progression

The first two weeks established a progression from fundamental machine-learning concepts to computer-vision applications:

Neural Networks & TensorFlow

Image Recognition & Classification

Object Detection

5.3 WEEK 3 — GO FURTHER WITH OBJECT DETECTION

The third week of the internship focused on **custom object detection**. This module extended the concepts introduced in Week 2 and focused on training custom object-detection models.

According to the internship curriculum, the module involved training custom object-detection models using **TensorFlow Lite** and the **TensorFlow Lite Model Maker library**. It built upon the skills developed during the introductory object-detection module.

5.3.1 Key Topics Covered

The major topics associated with this module were:

- Custom object detection
- TensorFlow Lite
- TensorFlow Lite Model Maker

- Training custom object-detection models
- Extending pretrained object-detection concepts

5.3.2 Custom Object Detection

Object detection involves identifying objects within an image or visual input. Custom object detection extends this concept by allowing an object-detection model to be developed for specific object categories.

The internship curriculum introduced the use of **TensorFlow Lite Model Maker** for training custom object-detection models. TensorFlow Lite was also included as part of the technology used in this learning module.

5.3.3 Learning Progression

The learning progression during the first three weeks can be represented as:

Neural Networks with TensorFlow

Introduction to Object Detection

Custom Object Detection

TensorFlow Lite / Model Maker

This progression demonstrates how the curriculum moved from fundamental neural-network concepts toward more specialized computer-vision applications.

✦ **Figure suggestion:**

Input Image → Object Detection Model → Object Identification → Detection Result

Caption: Figure 5.1: Conceptual workflow of object detection

Input Image → Object Detection Model → Object Identification → Detection Result

5.4 WEEKS 4–5 — GET STARTED WITH PRODUCT IMAGE SEARCH

5.4.1 Week 4 — Get Started with Product Image Search

The fourth week of the internship introduced the concept of **product image search**. The module focused on building a product image search feature for a mobile application using **on-device object detection**.

The module connected the concepts of object detection with visual product search. On-device object detection can be used to identify objects present in an image and support visual search functionality.

Key Topics Covered

- Product image search
 - On-device object detection
 - Visual search concept
 - Mobile application integration
-

5.4.2 Week 5 — Product Image Search

The fifth week continued the product image search learning pathway. The documented curriculum focused on detecting objects in **static images and live camera feeds on Android** to develop a visual product-search experience.

This module demonstrated the application of computer-vision concepts to different types of visual input, including stored images and real-time camera feeds.

Key Topics Covered

- Static image processing
 - Live camera feeds
 - Object detection
 - Android integration
 - Visual product search
-

5.4.3 Learning Progression

The progression from the previous module can be represented as:

Custom Object Detection

↓

Product Image Search

↓

Object Detection in Static Images

↓

Object Detection from Live Camera Feed

↓

Visual Product Search

The internship curriculum therefore moved from custom object detection toward a practical visual-search application area.

✦ **Figure for Page 12**

Input Image → Object Detection Model → Object Identification → Detection Result

Caption: Figure 5.2: Conceptual workflow of product image

5.5 WEEK 6 — GO FURTHER WITH PRODUCT IMAGE SEARCH

5.5.1 Introduction

The sixth week continued the **product image search** learning pathway and focused on extending the visual-search functionality through a backend component.

According to the official internship curriculum, this module involved **building and calling a product image search backend from a mobile application**. The purpose was to enhance the product-search feature introduced in the previous modules.

5.5.2 Key Topics Covered

The major topics covered in this module were:

- Product image search backend
- Backend integration
- Mobile application and backend communication
- Product-search functionality
- Extension of the visual-search feature

5.5.3 Backend Integration

A backend can provide services that process requests from an application and return the required information. In the context of the documented internship module, the product image search backend was connected with a mobile application to extend the product-search functionality.

The conceptual flow can be represented as:

Mobile Application

↓

Image / Search Request

↓

Product Image Search Backend

Search Processing

Product Search Result

5.5.4 Learning Outcome

This module extended the concepts of object detection and product image search toward **backend integration**. It provided exposure to how a mobile application can interact with a backend service as part of a visual-search workflow.

5.6 WEEKS 7–8 — GO FURTHER WITH IMAGE CLASSIFICATION

5.6.1 Week 7 — Go Further with Image Classification

The seventh week of the internship focused on **image classification**. The module introduced the development of **custom image-classification models** and aimed to improve the skills gained through the image-classification learning pathway.

Image classification is a computer-vision task in which an image is assigned to a particular category or class. It is useful in applications where visual data needs to be categorized automatically.

Key Topics Covered

- Image classification
- Custom image-classification models
- Image-based categorization
- Improving classification capabilities

5.6.2 Week 8 — Go Further with Image Classification

The eighth week continued the image-classification module. The documented curriculum focused on **creating a custom image classifier model and integrating it into an application**.

This module extended the concepts introduced during Week 7 by focusing on the integration of a custom image classifier into an application environment.

Key Topics Covered

- Custom image classifier
 - Model creation
 - Image classification
 - Application integration
-

5.6.3 Image Classification Workflow

A conceptual image-classification workflow can be represented as:

Input Image

↓

Image Processing

↓

Classification Model

↓

Predicted Class

This represents the general flow of an image-classification system and helps explain the concept covered during Weeks 7 and 8.

5.6.4 Learning Progression

The internship curriculum progressed from developing custom image-classification models to integrating a custom classifier into an application.

Image Classification

Custom Classification Model

Custom Image Classifier

Application Integration

5.7 WEEKS 9–10 — ASSESSMENT AND FINAL CREDENTIAL VALIDATION

5.7.1 Week 9 — Assessment

The ninth week of the internship was dedicated to **assessment**. It provided an evaluation stage following the completion of the learning modules covered during the earlier weeks of the internship.

The internship offer letter states that the program included **weekly assessments** to track progress and understanding. Certain modules also required the submission of project documentation and assignments.

Assessment Structure

The documented assessment structure included:

- Weekly assessments
- Progress and understanding evaluation
- Project documentation and assignments where required

- Final assessment

The final grade was based on overall performance, including weekly assessments, project submissions, and the final test.

5.7.2 Week 10 — Final Credential Validation

The tenth and final week was dedicated to **Final Credential Validation**. This represented the final stage of the documented 10-week internship structure.

According to the offer letter, successful completion of the required steps and assessments was necessary for receiving the **Virtual Internship Certificate**. The document also states that the offer letter becomes valid for official purposes only after successful completion of the program and fulfilment of the assessment requirements, including obtaining the final completion certificate.

5.7.3 Overall Internship Evaluation

The overall evaluation structure can be summarized as:

Weekly Learning

↓

Weekly Assessments

↓

Project Documentation / Assignments Where Required

↓

Final Assessment

↓

Final Credential Validation

↓

Virtual Internship Certificate

This sequence is based on the assessment and week-wise structure provided in the official internship offer letter.

TECHNICAL CONCEPTS

6.1 Neural Networks

Neural networks are computational models used in machine learning to learn patterns from data. They consist of interconnected computational units arranged in layers. During the internship, neural networks were introduced through the **TensorFlow** learning module in Week 1.

6.2 TensorFlow

TensorFlow was one of the primary technologies covered during the internship. The Week 1 module focused on programming neural networks with TensorFlow and introduced machine-learning concepts related to image recognition and classification.

6.3 Convolutional Neural Networks

Convolutional Neural Networks (CNNs) are neural-network architectures particularly associated with processing visual information. The internship curriculum introduced CNNs in the context of advanced image recognition and classification.

6.4 Object Detection

Object detection is a computer-vision task concerned with identifying objects within visual data. The internship introduced the fundamentals of object detection in Week 2 and then progressed to custom object detection in Week 3.

6.5 TensorFlow Lite

TensorFlow Lite was included in the custom object-detection module. It was used as part of the learning pathway for training custom object-detection models.

6.6 TensorFlow Lite Model Maker

The **TensorFlow Lite Model Maker library** was covered in Week 3 as part of the custom object-detection learning module. The curriculum specifically describes its use for training custom object-detection models.

6.7 Product Image Search

Product image search was covered during Weeks 4–6. The curriculum introduced product image search using on-device object detection, followed by object detection in static images and live camera feeds, and finally a product image-search backend integrated with a mobile application.

6.8 Image Classification

Image classification was covered during Weeks 7–8. The curriculum focused on custom image-classification models and creating a custom image classifier that could be integrated into an application.

LEARNING OUTCOMES

The AI-ML Virtual Internship provided a structured learning pathway covering important concepts and technologies related to **Artificial Intelligence, Machine Learning, and Computer Vision**. The internship curriculum progressed from neural networks and TensorFlow to object detection, product image search, and image classification.

7.1 Technical Learning

The major learning areas covered during the internship were:

1. Neural Networks and TensorFlow

Developed an understanding of neural networks and their relationship with TensorFlow through the first week's learning module.

2. Computer Vision

Gained exposure to computer-vision concepts through image recognition, object detection, product image search, and image classification.

3. Object Detection

Learned the fundamentals of object detection and the concept of using pretrained object detectors.

4. Custom Object Detection

Learned about custom object-detection models and the use of **TensorFlow Lite** and **TensorFlow Lite Model Maker**.

5. Product Image Search

Gained knowledge of product image search using on-device object detection, static images, live camera feeds, and backend integration concepts.

6. Image Classification

Learned about custom image-classification models and the integration of a custom image classifier into an application.

7.2 Overall Learning Outcome

The week-wise structure provided a progression from fundamental concepts toward more application-oriented AI and computer-vision topics:

Neural Networks

TensorFlow

Object Detection

Custom Object Detection

Product Image Search

Image Classification

This structured progression helped provide an organized understanding of the technical areas included in the internship curriculum.

7.3 Assessment-Based Learning

The internship also included weekly assessments designed to track progress and understanding. Certain modules required project documentation and assignments, while the final stages included assessment and final credential validation.

✦ **Figure for Page 17**

Figure 7.1: Learning progression during the internship create

Important: Use phrases such as “**gained exposure,**” “**learned about,**” and “**developed understanding**” rather than claiming specific model-development results or accuracy, because your uploaded documents do not provide individual performance results.

ASSESSMENT, CHALLENGES AND OBSERVATIONS

8.1 Assessment and Evaluation

The internship followed a structured evaluation process. According to the official offer letter, students were required to complete **weekly assessments** to track their progress and understanding. Certain modules also required the submission of **project documentation and assignments**.

The final evaluation was based on overall performance, including weekly assessments, project submissions, and the **Final Assessment Test**.

The final two stages of the documented internship structure were:

- **Week 9:** Assessment
- **Week 10:** Final Credential Validation

Successful completion of the required steps and assessments was necessary for receiving the **Virtual Internship Certificate**.

8.2 Technical Challenges and Observations

The official internship documents **do not provide a record of specific personal challenges faced by the student**. Therefore, no personal challenge or difficulty is claimed here.

However, the technical areas covered in the curriculum involve concepts that generally require careful understanding, including:

- Understanding neural-network concepts
- Working with TensorFlow
- Understanding object-detection workflows
- Understanding custom object detection
- Working with TensorFlow Lite

- Understanding visual product-search workflows
- Understanding image-classification models
- Understanding application integration

These observations are based on the technical areas included in the documented internship curriculum and should not be interpreted as specific personal difficulties.

8.3 Overall Observation

The internship followed a progressive structure, beginning with neural networks and TensorFlow and moving toward object detection, product image search, and image classification. The final stages focused on assessment and credential validation.

This structure provided a systematic pathway for studying different areas of AI and computer vision within a 10-week internship program.

FUTURE SCOPE

The AI-ML concepts covered during the internship provide a foundation for further learning and development in the areas of **machine learning and computer vision**. The internship curriculum included neural networks, TensorFlow, object detection, product image search, and image classification.

9.1 Future Applications

The concepts covered during the internship can be further explored in areas such as:

1. Computer Vision Applications

The knowledge of object detection and image classification can support further exploration of computer-vision-based applications.

2. Visual Search Systems

The product image-search concepts covered during Weeks 4–6 can be extended toward more advanced visual-search systems.

3. Mobile and Edge AI

The use of TensorFlow Lite and mobile application integration provides a foundation for exploring lightweight AI models on mobile and edge devices.

4. Advanced Image Classification

The custom image-classification concepts covered during Weeks 7–8 can be further developed for different image-based classification applications.

5. Advanced Object Detection

The custom object-detection concepts can be further explored for specialized computer-vision applications.

9.2 Future Learning Opportunities

Further learning can focus on:

- Advanced deep-learning techniques
- Advanced computer vision
- Model optimization
- Edge AI
- Mobile AI
- Advanced image classification

- Advanced object detection
- AI-based visual search

These represent **possible future learning directions**, not projects completed during the internship.

9.3 Career Relevance

The internship curriculum provided exposure to technologies and concepts relevant to the broader AI/ML field. Continued practice with machine learning frameworks, computer-vision techniques, and model development can help build deeper technical capabilities in AI and machine learning.

The internship itself was designed to provide **industry-relevant skills** and strengthen confidence in the subject area.

CONCLUSION

The **AICTE–EduSkills Virtual Internship Program** provided a structured 10-week learning experience in the **Google AI-ML** domain. T29 internship was scheduled from **January 2026 to March 2026** and followed a week-wise curriculum covering important areas of Artificial Intelligence, Machine Learning, and Computer Vision.

The internship began with **neural networks and TensorFlow**, including concepts related to image recognition and classification. It then progressed to **object detection and custom object detection**, including the use of TensorFlow Lite and TensorFlow Lite Model Maker.

The subsequent modules focused on **product image search**, including object detection in static images and live camera feeds and the integration of a product image-search backend with a mobile application. The final technical modules covered **custom image classification and application integration**.

The program also included weekly assessments, project documentation or assignments where required, a final assessment, and final credential validation. Successful completion of the required internship activities and assessments led to the award of the Virtual Internship Certificate.

Overall, the internship provided structured exposure to important AI-ML and computer-vision concepts and established a foundation for further learning in areas such as machine learning, deep learning, object detection, image classification, visual search, and mobile/edge AI.
